

VERDAPROTECT - for aphid control in vegetables

Easier, faster and safer application than any chemical treatment.

ADVANTAGES

- › Protects vegetable crops against aphids
- › Ideal for mixed vegetable crops
- › No need to identify aphids
- › No development of resistance possible
- › No harvest interval
- › Saves on aphicides, so less residue in IPM
- › Easy integration with chemical crop protection
- › Long lasting effect at broad temperature range
- › Reliable and consistent quality
- › Quick and easy application
- › Safe for humans, plants, and the environment

TARGET CROPS

Mixed vegetable crops (incl. pepper, eggplant, cucumber, tomato)

EXPERIENCE

The number of available active substances and the maximal authorized residue (MRL) level for vegetables are constantly decreasing. Increasing multiresistance to insecticides also makes chemical control of aphids more and more complicated. By replacing aphicide application, VerdaProtect helps to solve all these emerging problems by controlling all common aphids in vegetables. And it comes in ready-to-use units, which are much easier to apply than any chemical treatment.

VerdaProtect is mainly used in mixed vegetable crops including sweet pepper, eggplant, and cucumber in different European countries, and assures an efficient control of aphid populations (including *Aphis gossypii*, *Macrosiphum euphorbiae* and *Aulacorthum solani*).
