

## Early Season Considerations

As highlighted in previous bulletins, roots are key to the plants success. Strong early establishment helps to build a robust root structure, enabling the plant to effectively utilise water, increase nutrient use efficiency and reduce pest and disease issues throughout the season.

Early applications of **Kelpak** and **O-Phyte** as a combined foliar application will promote deeper tap roots, encourage root branching and stimulate fine root hair growth.

## Bio 20 - Ultimate Plant Nutrition

Once plants have established, switch from Kelpak to Bio 20. Bio 20 offers ultimate plant nutrition and provides a “green up effect” foliar feed and biostimulant. It provides the plant a broad range of NPK and trace elements to provide the building blocks required for additional plant growth.

Supplied in a balance to provide strong growth Bio 20 reduces soft growth, therefore producing a healthier marketable plant.

Bio 20 is key in peat free growing media situations.

## Timings and Rates

### Kelpak

Apply 2ml/L every 14 days (3-4 applications) combined with:

### O-Phyte

Apply 2ml/L every 14 days (3-4 applications)

### Bio 20

Apply 2-3ml/L every 14 days
